## Animal Preference

The **PROVEN** White Clover  
for improved cattle performance  
on permanent pasture

### Get the yield and persistence advantage with RegalGrazze Ladino Clover

Aggressive growing small and intermediate leaf type white clovers often take over and crowd out desired tall fescue, orchardgrass or bermudagrass in permanent pastures. This upsets the grass/legume balance and holds back cattle performance.

Choose **RegalGrazze** large leaf ladino clover instead of small or intermediate leaf types the next time you renovate or overseed a pasture. You'll have the extra daily gain, expanded grazing season, free nitrogen credits and fescue toxicity benefits for healthier cattle. Plus, you'll enjoy the persistence that maximizes pasture profitability season after season.

Tall, upright growing **RegalGrazze** has the bred-in ability to maintain the Extension recommended 20-30% of a pasture dry matter yield from the legume component. **RegalGrazze** has Overgraze Protection™ to rejuvenate itself after abusive grazing and bounces back with the grass into a healthy, balanced stand.

Ask your local seed dealer for **RegalGrazze**. Don't settle for a substitute; if it's not in stock, ask him to order it for you. Remember, with white clover leaf size and growth habit do make a difference in pasture performance and your profitability.
